Sympatex and the Environment

Environmental considerations are an important aspect of the Sympatex company philosophy. The Sympatex membrane contains no halogens and its manufacture process is solvent free. It is made of 100% polyester, which means it can easily be recycled at the end of a garment's life without damaging the environment. And, as it is totally windproof, Sympatex reduces the need for insulation, saving large amounts of raw materials. In 1998, Sympatex Technologies was the first company in the functional garment sector to set up an ecology profile for their membrane by external specialists.

The Sympatex membrane is kind to the skin, being totally hypoallergenic. All Sympatex membrane products hold the ecology certificate "Ecolabel", set up by an independent ecology institute, stating that they meet the human-ecological requirements of the standard presently established.
